

1. The first thing to pay attention to is that it should not be exposed to direct sunlight. Strong sunlight will accelerate the aging of imitation leather, and the aging degree of imitation leather is much faster than that of real leather will crack.
2. The second thing to pay attention to is not to pull the difference between the textile leather and the real leather because the strength and toughness between the two are different, and the real leather is very strong. Textiles are relatively fragile and will tear if pulled hard.
3. The third thing to pay attention to is to avoid scratches. This is the same as the leather precautions. If a section is cut, its aesthetics and practicality will be lost, and the whole will be damaged. Although it can be repaired, it is also very ugly.
4. The fourth precaution is to stay away from fire sources. Compared with real leather, imitation leather is more likely to catch fire, and once it catches fire, the fire will spread. It will emit thick smoke and a poisonous smell, which will seriously endanger people's health.
5. The fifth thing to pay attention to is preventing high temperatures and low temperatures. High temperature means that high temperature above 40 degrees will accelerate the aging of the imitation belt, while low temperature means that the imitation leather will be easily brittle if it is below zero.
6. The sixth thing to pay attention to is to keep the surface of the imitation leather clean. It is much easier to take care of imitation leather than genuine leather. Usually, it is enough to scrub with clean water. In serious cases, you can also use soapy water to scrub, and it will be as clean as new.
